

Dr O Malik,
Charing Cross Hospital
Fulham Palace Road
London
Greater London
W6 8RF

Patient: Mr James Saint [REDACTED]
Address: [REDACTED]
Hospital No: 22141884 **CRIS No:** 5427158
Referring clinician: Dr O Malik

Date of examination: 23-Jun-2025

REPORT

MRI Head: (reported 24-Jun-2025)

Indication: Left sided syndrome.

Technique: Routine brain and cervical spine.

Findings: Imaging of the brain shows no mass lesion or hydrocephalus. There is a minimal prominence of the CSF spaces likely within normal limits. There is a mature likely very old right cerebellar infarct.

There is a left mastoid effusion with a small amount of fluid seen in the right mastoid and again these changes are probably chronic. No mass in the posterior nasal space. Minor paranasal sinus inflammatory type changes in the sphenoid and ethmoid sinuses. The major vessels appear patent. No chiari malformation. No orbital or pituitary lesion. No significant white matter lesions. No evidence of demyelination or inflammation. No old traumatic brain damage. No blood products. No diffusion abnormality. No skull vault lesion. Fat planes below the skull base are preserved.

Imaging of the cervical spine shows normal alignment. Vertebral body and disc heights are generally well maintained. There are no prominent disc osteophyte bars at any level with just minimal changes at C5-C6 and C6-C7 with mild indentation of theca but no cord compression or cord lesion or syrinx. On the sagittal images there does not appear to be any evidence of compromise of exiting nerve roots.

Unfortunately the patient departed the scanner before any axial images could be performed. No infiltration. No clear compromise nerve roots at the C3-C4 level. There is no cord compression or cord lesion or syrinx and there is no cord atrophy.

Comment: No clear cause for symptoms identified.
